

H

IMPLEMENTATION AUDIT

SEO — manual work only

Everything implementable in code is done. This file contains **only** the

things that cannot be, with exact instructions. Ordered by return.

Tick items off as you go — several of them block the others.

Before launch (Tue 15 September)

1. Google Search Console — nothing starts until this is done

- [] <https://search.google.com/search-console> → **Add property** → **Domain** → `hardikajmeriya.com`
- [] Verify by **DNS TXT**. Cloudflare → DNS → Records → Add → TXT, name `@`, paste the value. Domain verification covers www, subdomains and both protocols in one go; the URL-prefix method does not.
- [] **Sitemaps** → submit `sitemap.xml`
- [] **URL Inspection** → paste `https://hardikajmeriya.com/` → **Request indexing**
- [] Repeat URL Inspection for `https://hardikajmeriya.com/resume`
- [] **Settings** → **Users and permissions** → confirm only you have access

Requesting indexing is what turns "eventually" into "a day or two". Do it for both URLs on launch day.

2. Bing Webmaster Tools — 10 minutes, and it feeds Copilot

- [] <https://www.bing.com/webmasters> → **Import from Google Search Console** (one click once step 1 is done)
- [] Submit the sitemap
- [] **Settings** → **IndexNow** → enable. Cloudflare also has a one-toggle IndexNow integration under **Caching** → **Configuration**; either is fine, do not do both.

3. Rich Results Test — confirm the graph is read as intended

- [] <https://search.google.com/test/rich-results> → test `https://hardikajmeriya.com/`
- [] Expect: **no rich results at all**, and that is the correct outcome. Google removed FAQ rich results on **7 May 2026** and deprecated HowTo in 2023. Person, ProfessionalService, SoftwareSourceCode and ItemList have never had a visual rich result. The test should report the types as `detected` and `valid` with zero errors — that is what "passing" looks like for this site.
- [] <https://validator.schema.org/> → same URL → expect **0 errors, 0 warnings**

4. Reciprocal profile links — this is what makes `sameAs` mean anything

`sameAs` is a claim that two profiles are the same person. A link back is what **confirms** it. Without the return link the claim is unverified.

- [] **GitHub** → Settings → Public profile → **Website** = `https://hardikajmeriya.com`
- [] **LinkedIn** → Contact info → **Website** = `https://hardikajmeriya.com` (label: Personal)
- [] **LinkedIn** → **Featured** section → add the site as a link

5. Fix the GitHub profile — it currently contradicts the site

Your `sameAs` points at a profile whose bio reads "Android & DevOps Enthusiast — building seamless mobile experiences", with `AndroidStudioWebApp`, `SQL-Pizza-Sales` and `Titanic-Data-Analysis` pinned. **None of your four portfolio projects are pinned.** For entity SEO this actively works against you: the corroborating source describes a different professional.

- [] Bio → something matching the site, e.g. "Full-stack developer (MERN) and cloud engineer. I build web applications and deploy them to production on AWS. `hardikajmeriya.com`"
- [] Pin the four portfolio repos: `MedCare`, `ultimate-devops-project-demo`, `k8s-kind-voting-app`, and `DCPVAS` once pushed
- [] Location field → `Rajkot, Gujarat, India` (currently `Rajkot,Gujrat,India` — misspelled, and missing spaces)
- [] **Remove the broken** `mailto:hardik@example.com` from your profile README — it is a live dead link
- [] Set the README email to your one business address (see item 6)

6. Pick ONE business email

You currently publish three:

WHERE	ADDRESS
Site, schema, <code>llms.txt</code>	<code>hardik.ajmeriya89@gmail.com</code>
GitHub README	<code>hardik.ajmeriya12@gmail.com</code> + a <code>hardik@example.com</code> placeholder
Cloudflare / admin	<code>hardikpt95@gmail.com</code>

- [] Decide which is the business address
- [] If it is **not** `hardik.ajmeriya89@gmail.com`, change `PERSON.email` in `app/src/data/seo.js` — one line, everything else is derived from it
- [] Update the GitHub README to match

Keep `hardikpt95@gmail.com` for Cloudflare and the admin panel. That one is infrastructure, not a public contact, and it is fine for it to differ.

7. Fill in `alumniOf` — I cannot, you can

Your GitHub README says "MCA Graduate" in one place and "ECE Graduate" in another. I will not guess at your education.

- [] Add to `app/src/data/seo.js`, inside `PERSON` :

```
alumniOf: {
  name: 'Your University Name',
  url: 'https://university-website.example', // the official site
},
```

- [] Tell me and I will wire it into `scripts/build-schema.mjs` as a proper `EducationalOrganization` node, or add it yourself following the `worksFor` pattern already there.

Education is a strong disambiguation signal for a person entity: it is a fact a third party (the university) can corroborate.

Month 1

8. Google Business Profile — the local lever, unused

You are in Rajkot and the schema now says so, but nothing outside your own site confirms it.

- [] <https://business.google.com> → create a profile
- [] Category: **Website designer** (closest match; **Software company** as secondary)
- [] **Service area business** — do not publish your home address
- [] Website → `https://hardikajmeriya.com`
- [] Verification is usually by postcard or video; allow 1–2 weeks

This is the single strongest signal available for "web developer Rajkot" and it costs nothing.

9. The first real backlinks

Five genuine links beat fifty directory submissions. In order of ease:

- [] GitHub profile website field (item 4)
- [] LinkedIn website + Featured (item 4)
- [] Add `hardikajmeriya.com` to the README of each of your four project repos
- [] One post on **dev.to** or **Hashnode**, with `canonical_url` pointing at your own domain

Post about work you have already done. Your commit history contains at least three things other developers would link to:

- verifying Cloudflare Access JWTs instead of trusting the forgeable `Cf-Access-Authenticated-User-Email` header
- discovering that no major AI crawler executes JavaScript, and prerendering a React site because of it
- finding that a contact form with an auto-reply is an open email relay without a per-recipient rate limit

10. Sitelinks require more URLs — see the report

- [] Write one case study, published at `/work/cureneed`

- [] Tell me when the content exists and I will add the route, the internal links and a legitimate `BreadcrumbList` (which becomes valid the moment a hierarchy exists)

Do **not** split the existing page into `/about` , `/contact` , `/tech` to chase sitelinks. That turns one decent page into five thin ones, and thin pages do not get sitelinks either.

When the accounts exist

11. Add real profiles to `sameAs`

Only when the account **exists and links back to your site**:

- [] Add the URL to `PERSON.sameAs` in `app/src/data/seo.js`
- [] Run `node scripts/schema.test.mjs` — it fails on placeholders and non-https URLs

Worth having, roughly in order: **X/Twitter**, **Stack Overflow**, **dev.to**, **Instagram** (if professional). A dormant account with no link back adds nothing; leave it out until it is real.

12. Wikidata — the actual knowledge-panel path

A panel needs an entity Google's Knowledge Graph trusts. Wikidata is the most common route, and it has a **notability requirement** you do not meet yet: you need to be the subject of published sources you did not write.

Not something to attempt now. Revisit if you are ever interviewed, speak at a conference, or your work is written about somewhere you do not control.

Never do these

Listed because they are commonly recommended and would actively hurt you:

- **Directory-submission services / paid link packages.** Link schemes, manual action risk.
 - **`sameAs` entries for accounts that do not exist.** A 404 in `sameAs` weakens the entity.
 - **`aggregateRating` or `Review` markup with no real reviews.** One of the most-actioned structured-data violations.
 - **`SearchAction` without a search endpoint.** Invalid; there is a test that fails if it is added.
 - **Keyword-stuffed footer text** ("MERN developer Rajkot | React developer Gujarat | ..."). Google has handled this since 2011.
 - **Splitting the homepage into thin pages** for sitelinks.
-

Quick status

#	TASK	BLOCKS	EFFORT
1	Search Console	everything	15 min
2	Bing Webmaster	Copilot	10 min
3	Rich Results Test	—	5 min
4	Reciprocal profile links	sameAs credibility	10 min
5	GitHub profile	entity consistency	20 min
6	One email	entity consistency	10 min
7	alumni0f	—	5 min + my help
8	Business Profile	local search	20 min + wait
9	First backlinks	ranking	ongoing
10	Case studies	sitelinks, long-tail	days
